

July 2019: 235 x 156:
324pp 717 illustrations

Hb: 978-0-367-14574-3 | £70.00
eBook: 978-0-429-05276-7

TABLE OF CONTENTS:

1. Modern understanding of conservation and of heritage structures
2. History of conservation
3. Construction materials and main structural elements
4. Vaulted structures in history and modern structural solutions
5. Ancient sizing rules and limit analysis of masonry arches
6. Damage and collapse mechanisms in masonry buildings

Historic Construction and Conservation

Materials, Systems and Damage

Pere Roca, Technical University of Catalonia, Spain, **Paulo B. Lourenço**, University of Minho, Portugal and **Angelo Gaetani**, Sapienza University of Rome, Italy

This book brings together the history of construction, materials and structural elements, with the history of conservation. It explains structural decisions made during the construction process which underlies the damage and collapse mechanisms in masonry for different forms of loading. Excess permanent loading and settlement is differentiated from environmental and anthropogenic actions such as earthquake or incorrect intervention. The team of authors address the history of conservation by exploring materials and structures and the history of construction and damage. It is for civil engineering and architecture, as well as for archaeology and art history.
